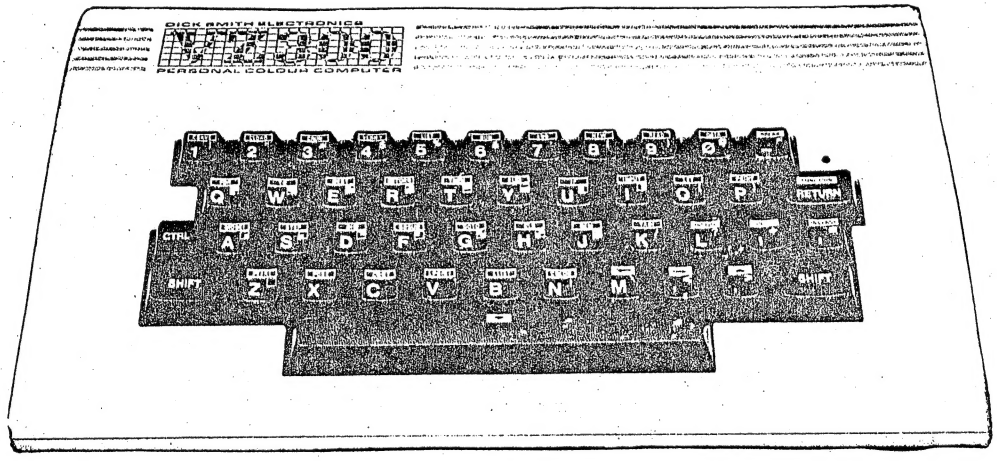
MARCH/APRIL 1987 ISSUE # 10/11

HUNTER VALLEY

VZ JOURNAL



PRODUCED BY H.V.V.Z.U.G.

Carrying on from Jan/Feb issue the Hunter Valley VZ Journal will be published Bi-Monthly for the forseeable future. This will bring us in line with other VZ Publications and also give us more time to produce a better quality Journal.

BELIEVE IT OR NOT :-
Two female computers were overheard gossiping. (Via their speech synthesisers - Ed.). One asked the other. "How did your honeymoon go" ? "terrible", replied the other, "He left his Joystick at home".

Since our comments last month we had a few NIBBLES. Here are some of the comments.

Dave Boyce - It is nice to receive a Mag. (sorry Journal) that is pages thick. Dave also suggested that we do an annual index together with notes and errata. Thanks for the suggestion Dave, we had something similiar in mind.

Scott Le Brun - I've been reading the Jan/Feb issue of your Journal and IT'S GREAT. Thanks Scott. The RESTORE article, I found very useful, as I sometimes accidentally NEW a program and it's not stored on tape. Take a bow Dave Mitchell.

With this issue we are introducing a new service to our members on a trial basis. Most programs appearing in this Journal can be obtained from Hunter Valley VZ Users' Group simply by sending a TAPE or DISK together with return POSTAGE and PACKING included. When sending disks make sure you use stiff cardboard as support as the postman likes folding disks in half to fit in your letter box. 'P' plates are ideal as support.

DISK DRIVE HINTS AND TIPS - - - -

Hints for the VZ abound while ones for the disk drive are few and far between. Here are some you may find usefull.

How many times have you Run a program without SAVING it first and lost it all because the VZ or drive hung up. Fear not, there is a simple solution. Just add a couple extra lines to your program. The trick is to SAVE your program regularly.

```
1500 ERA"FILENAME"
1600 SAVE"FILENAME":CLS:DIR
```

The first time you save your program you would use line 1600 :-

```
GOTO 1600
```

This will SAVE your program, clear the screen and show you the DIRECTORY. Then at regular intervals type in :-

```
GOTO 1500
```

Provided you a have disk in the drive line 1500 will ERASE your program while line 1600 will SAVE an updated version of your program.

Instead of line 1500 and 1600 any line number of your choice can be used. Have a look at lines 1500 and 1600 of Snoopy Calendar program in this issue for an example.

CHANGING SNOOPY CALENDAR FOR PRINTER/PLOTTER USE by Dave Boyce.

Now that You have typed in Part 2 of the Calendar we can procede. Load in the completed program and follow the instructions given below.

Delete Lines 162, 348, 558 and 820.

Type in -: SAVE"SNOCALPP" and press RETURN. (DISK SAVE)

Type in -: CSAVE"SNOOPY/CAL" and press RETURN. (TAPE SAVE)

Add Lines 70, 80, 160, 285, 595 and 1255 as Listed below.

Change Lines 90 to 120, 345, 365, 375, 385, 552, 580, 585, 590, 830 and 1500 as Listed below.

Also change the TAB(30)'s in Lines 850 to 1350 to TAB(15)'s as the example shows below.

Type in -: GOTO 1500 and press RETURN. (DISK SAVE)

Type in -: GOTO 1600 and press RETURN. (TAPE SAVE)

NOTE :- In case of DISK SAVE use line 1500 and line 1600 for TAPE SAVE whenever insructions call for program SAVE.

```
70 '  FILE - SNOCALPP
80 '  ##  SNOOPY CALENDAR ##
90 '  FOR THE PRINTER/PLOTTER ONLY
100 ' ## LINE 160 WILL SET YOUR PRINTER/PLOTTER
105 ' IN THE CORRECT MODE
110 ' ### RUN LINE 595 TO RETURN TO TEXT MODE

80 '
100 'WHEN INVERSE CHARACTERS ARE SENT TO A DOT MATRIX PRINTER
110 'THE PRINTER SHIFTS TO GRAPHICS MODE AND REQUIRES A ROUTINE
120 'TO SUPPLY THE APPROPRIATE SHAPES TO THE HEAD. (NORMAL
130 'CHARACTERS ARE HELD IN THE PRINTERS ROM)
140 'IN THE VZ COMPUTER A TABLE OF SHAPES IS LOCATED AT
150 '3B94H TO 3CD3 IN ROM. THERE ARE 64 CHARACTERS, EACH USING
160 '5 BYTES TO DEFINE THEIR GRAPHIC SHAPE. THE SHAPES MAY BE
170 'DECODED AND OUTPUT TO THE SCREEN AS IS DONE IN THIS
180 'PROGRAM. NOTE THAT THERE ARE SOME ERRORS IN THE ROM.
190 'THE 5 BYTES DEFINE A 5 BY 8 DOT MATRIX WHICH IS THE SHAPE
200 'OF THE CHARACTER, WHICH INCIDENTLY ARE NOT ORDERED
210 'ACCORDING TO THE ASCII CODE.
220 'THE FIRST BYTE DEFINES THE LEFT HAND EDGE OF THE CHARACTER-
230 'WHICH IS THE FIRST PRINTED DURING A PASS OF THE PRINTER
240 'HEAD. IN TANDY PRINTERS THE MSB IS THE LOWERMOST PIN OF THE
250 'HEAD AND THE LSB IS THE UPPERMOST PIN. THE PINS ON EPSON
260 'PRINTER HEADS ARE ARRANGED IN THE OPPOSITE SENSE. THIS
270 'REQUIRES THAT THE BITS IN EACH BYTE BE REVERSED.

DISK DRIVE HINTS AND TIPS - - - -

Most Dos commands can be used from within a program, but the DOS manual fails to inform you of the correct syntax. EG :-

100 IFA$="D"THENDIR : This will not work although it's correct for BASIC, but not for the DOS.

100 IFA$="D"THEN:DIR : A colon (:) must be added between THEN and DIR for it to work. The same goes for most other DOS commands.

BREAK :- Although there's a BREAK function for basic the DOS Manual again fails to inform you of the DOS version. It could'nt be simpler. Just use the BREAK (-) MINUS key by itself without CTRL key. It will get you out of some problems but not all.

Anyone with any hints for the disk drive please let us know so we can share with other users.

Disk Drive owners, the Magic VZ is not for you, but tape owners rejoice as you can do Magic with your VZ. And how to accomplish this Magic ? Simple, just install a Magic Eprom in your VZ200/300 and away you go. The Magic Eprom is a 4K Eprom that is written for the range 4000-4FFF HEX. It contains the following three utilities which are available seperately on tape. 1) EB1 - 2) MDR3 - 3) AR1 :-

EB1 - EXTENDED BASIC :-

All 45 missing TRS-80 Level 2 Keywords are translated into their Tokens and are listable any time. This gives you 19 additional commands/functions and all the disk command exits which are very handy to link any M/L programs. Note that basic programs written with EB1 will run on any other VZ even if commands/functions from the list below are used.

ADDITIONAL COMMANDS/FUNCTIONS :-
POS, FRE(X$), MEM, ERR, ERL, FIX, CDBL, CSNG, CINT, ON, AUTO, DEFINT, DEFSNG, DEFDBL, DELETE, RANDOM, VARPTR, STRING$, RESUME.

DISK COMMANDS/FUNCTIONS :-
LOF, LOC, EOF, CVD, CVS, CVI, DEF, PUT, GET, MKD$, MKS$, MKI$, TIME$, CMD, FN, LSET, RSET, OPEN, CLOSE, LOAD, SAVE, KILL, NAME, MERGE, FIELD, INSTR.

Information is given on how to realise ON ERROR, TRON, TROFF and DEFSTR.

MDR3 - MERGE/DELETE/RENUMBER :-

The merge routine will merge any number of basic programs up to memory capacity. The only rule is that the program you wish to merge must have it's first line number higher than the last line of program in memory.

REN X,Z or REN X-Y,Z.

This is a particulary usefull RENUMBER routine. You can renumber whole or part of your program with choice of increment.

DELETE X/X-Y/-X :- The specified Line(s) are deleted.

AR1 - ARRAY-UTILITY/RESTORE N :-

This powerfull utility can dump 800 records of 16 Characters in less than 4 minutes onto tape. With this ARRAY Utility you can SAVE or LOAD whole ARRAYS at the tape speed of 600 baud, regardless of the lenght or the number of dimensions. RESTORE N enables you to move the DATA pointer for the READ command to the first element of any DATA line in your program. Important, the array utility will only work if the basic program was written by an extended basic which accepts the disk commands LOAD, SAVE, KILL and NAME.

IMPORTANT NOTE :-

EB1 can be loaded with either MDR3 or AR1. They can be loaded any time without destroying a BASIC program.
EB1, MDR3, AR1 and MAGIC EPROM are available from :-

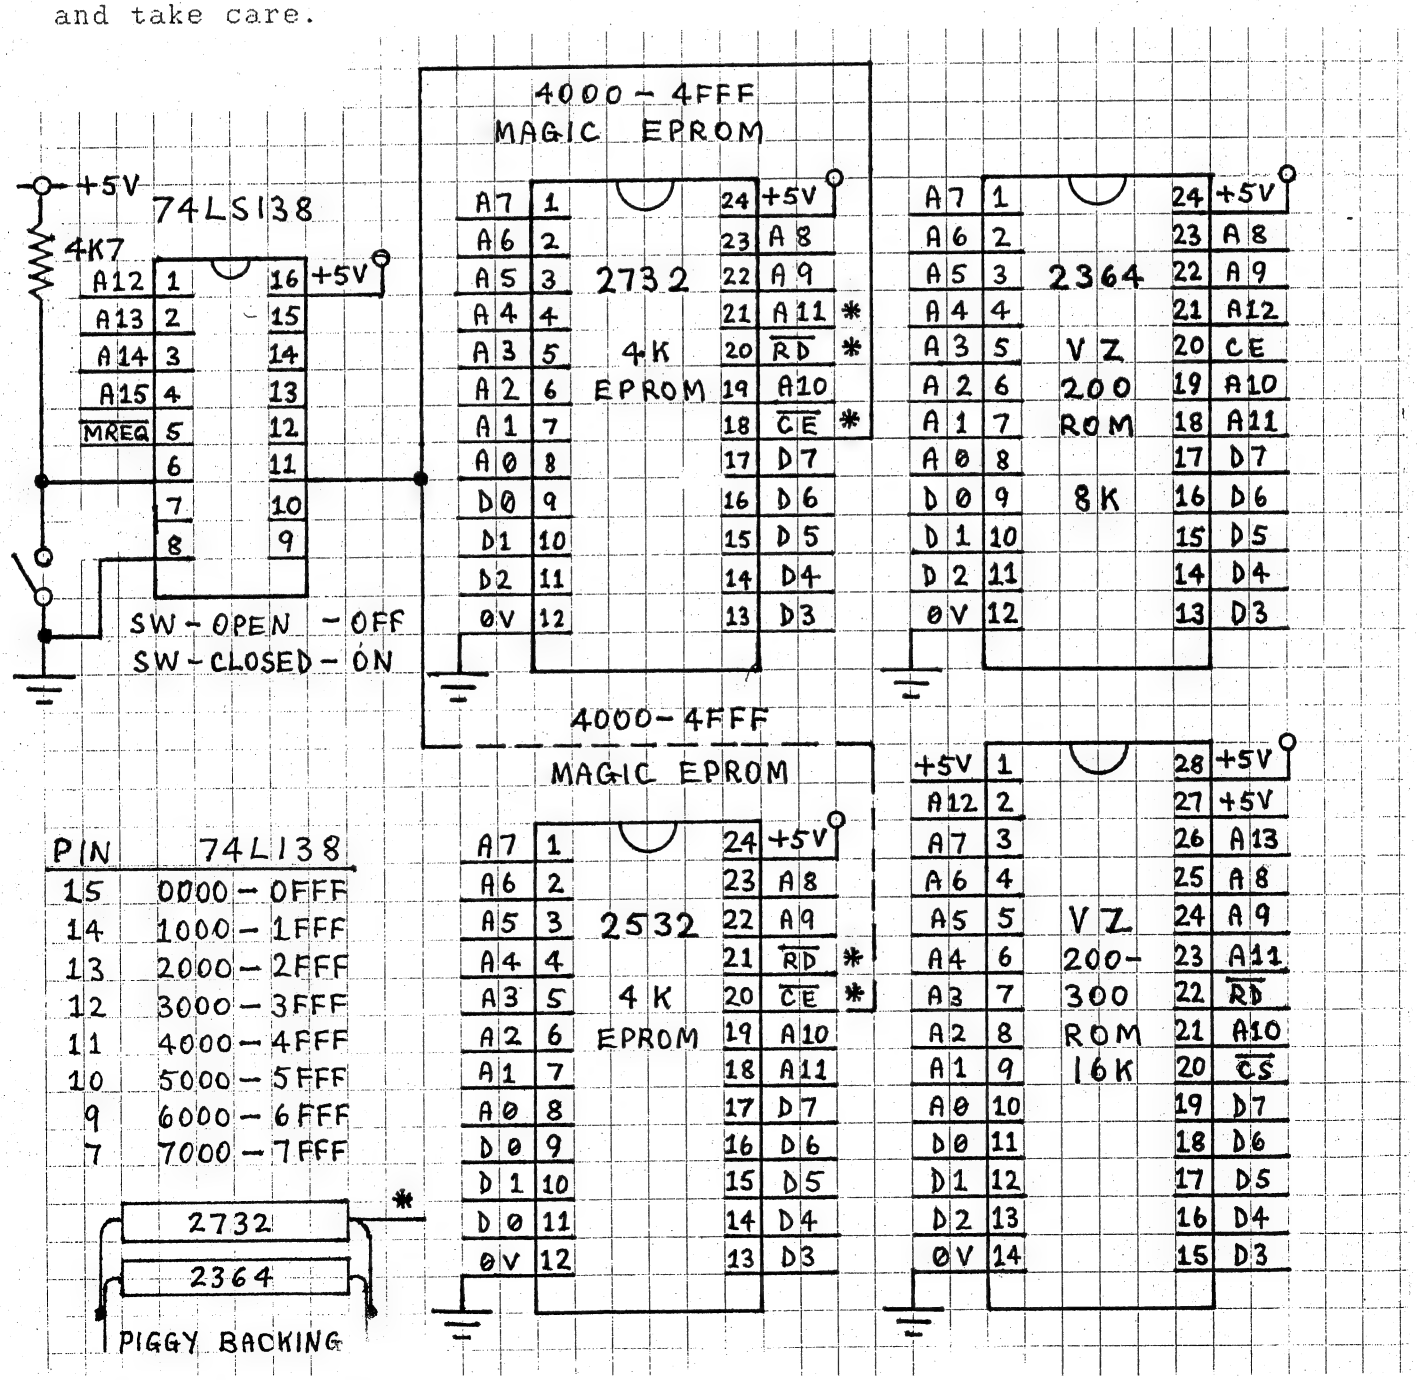
W.Obrist
50 Cobham Ave.
West Ryde
N.S.W. 2114

EB1, MDR3 and AR1 are $15.00 each.
MAGIC EPROM is $45.00.
They are last year's prices so check.
State RAM size. EG :- 8K, 24 K, ETC.

MAGIC-EPROM :- This Eprom contains all three utilities described previously EB1, MDR3 and AR1. When correctly installed all pointers are changed during power up resulting in a very powerfull VZ. The beauty of the Magic Eprom is that it works with any memory size and all commands and functions are available at power up.

The Eprom is available as 2532 or 2732, and don't forget to mention your choice. To make your choice easier pinouts and connecting circuit diagrams are shown. I piggy backed mine on a 2364 8K-ROM inside the VZ200. Some VZ200's and VZ300's have 16K ROMS and their pinouts are also shown.

Both the 2532 and 2732 Eproms will fit nicely on the 2364 Rom in VZ200. Astericks are shown which pins to bend up when piggy-backing on 2364 VZ Rom. On the 2532 two pins must be bent up while on 2732 three are bent up and connected to the appropriate signals. Instead of soldering the Eprom directly to the Rom a socket can be used. If piggy-backing on the 16K Rom then the 2732 would be a better choice as only pins 18 and 24 need bending up. Study the circuits carefully before proceeding and take care.



FILESEARCH 2.0 (C)1987

FILESEARCH is a utility program, consisting of two independent modules TAPESEARCH and DISKSEARCH, which provides useful information about programs stored on tape or disk. Although the data appears on the screen, selection of the printer option enables a printout to be obtained.

The initial letter identifies the type of program:

T: Basic Program
B: Machine Code Program
D: Data Files
W: Editor Assembler Source Code

TAPESEARCH reads the leader of programs and files stored on tape and prints the information in this form:

T:NAME OF PROGRAM 7AE9 8EA4 13BB

Following the program type and name, the start and end addresses and the length of the program will be printed, in hex. Only Data Files do not have a start and end address.

TAPESEARCH will also identify Data Files saved using the D.S.E. Word Processor, which cannot be identified during normal tape operations. When the printer option is selected only Data Files which have a name are output to the printer although all files found are printed on the screen.

DISKSEARCH reads the disk directory, and prints the data in this form:

T:FILENAME 0A 04 7AE9 8EA4 13BB

Following the filetype and filename the track and sector numbers, indicating where the data is stored on the disk, are displayed in hex form. Immediately after this the start and end addresses and the length of the program are printed, also in hex.

If the directory contains more than 13 entries, as the data is being printed, the screen will scroll. Pressing the SPACE bar will hold the displayed data. If the printer. option has been chosen, you can select, each time a directory is displayed, whether to output the data to the printer or not.

If a disk error occurs during reading, control will return to DISKSEARCH. Should the program not return from reading a disk, such as if an attempt is made to read an unformatted disk, control can be regained by pressing the BREAK key alone.

FILESEARCH can be safely used by non-disk owners as a check is made for the presence of the Disk Operating System before entering DISKSEARCH. Pressing the CONTROL and BREAK keys together, at any time, will enable a return to the start of the program.

DICK SMITH ELECTRONICS - - - - -

VZ-300 MAILING LIST TAPE TO DISK FILE CONVERSION

Below are the changes to be done to the B.A.S.I.C. program to allow files to be saved on disk instead of tape for (X-7259) Mailing List program.

Once you have LOADed Mailing List BREAK the program and type in the lines below pressing (RETURN) after each line.

```
1040 PRINT@162,"2. READ DATA FROM DISK";
1080 PRINT@290,"6. WRITE DATA TO DISK";
5020 PRINT@270,"[WRITE DATA TO DISK]"
5030
5040
5050
5060
5070
5080
5110
5120
5205 ERA"MAILDATA"
5210 OPEN"MAILDATA",1:PR#"MAILDATA", DT
5230 PR#"MAILDATA",D$(N)
5240 NEXT:CLOSE"MAILDATA"
6020 PRINT@79,"[ READ DATA FROM DISK ]";
6030
6040
6050
6060
6070
6080
6100 OPEN"MAILDATA",0:IN#"MAILDATA", DT:IF DT=0THEN 6135
6120 IN#"MAILDATA",D$(N)
6135 CLOSE"MAILDATA"
7030 PRINT@199,"[FUNCTION COMPLETE]";
7050 SOUND 30,2:RETURN
```

Now SAVE"MAILLIST" to disk. Type NEW then press RETURN.
Type in and RUN program below.

```
10 OPEN"MAILDATA",1
20 PR#"MAILDATA",0
30 CLOSE"MAILDATA"
```

The above program has prepared the disk with the MAILLIST program to SAVE and READ files. The above program will never be used again.

Now you have finished just RUN"MAILLIST" and the instructions are as per old Mailing List program. The only difference is that it SAVES and LOADS files a lot faster.

Compiled by Jamie PERRY

G'day! My last article, (which was also my first), seems to have hit the spot, so I'm back for a sequel ... (Anyone want to buy the Movie Rights ? - Ed.)

OK! You're in for a more complex one this time. This one covers a lot and demonstrates a lot of stuff. Like last time the program listing is given first, then each line and command is explained.

```
10 CLS
20 A=RND(100)
30 INPUT "GUESS MY NUMBER (0-100)";B
40 IF A>B INPUT "HIGHER";B
50 IF A<B INPUT "LOWER";B
60 IF A=B PRINT "THAT'S RIGHT":GOTO 80
70 GOTO 40
80 INPUT "TRY AGAIN (Y/N)";C$
90 IF C$="Y" GOTO 10
100 PRINT "TYPICAL HUMAN!":END
```

This is a simple little game where you can communicate with the computer. It will choose a number at random and you have to guess what the number is. You will be given clues like "HIGHER" or "LOWER". By looking at some of the features of this programme, you might be able to see how easy it is to write your own games.

```
10 CLS      :Clears the screen.
```

```
20 A=RND(100)
```

This is a feature we have not looked at yet. It is a function which enables the computer to chose a number at random. For this, we just print "RND" and straight after, you state (in brackets), the highest number you wish to be chosen. So if you were choosing lotto numbers, it would be : RND(40). Get it? In line 20, we have labelled our random number "A" by saying that "A=RND(100)".

```
30 INPUT "GUESS MY NUMBER (0-100)";B
```

This is another function we have not yet tackled, but don't worry, it is not hard to understand. INPUT means that the computer is looking for an input from you. It has told you what sort of input it is looking for, by asking you to "GUESS MY NUMBER?". The PRINT and INPUT statements are very similar but there is one difference. The PRINT command simply prints a message on the screen, whereas the INPUT command both prints a message on the screen, and waits for a reaction from the user. Your reaction is then labelled with another variable : we have labelled the response "B". Don't forget the semi-colon (;), and there is no need to type in question marks on the VZ as it puts them up for you the moment it sees an INPUT statement.

```
40 IF A>B INPUT "HIGHER";B
```

This says exactly that : if the random number (A) is bigger than the response (B), then tell the user that it is higher, wait for another guess, and replace his or her last response (B) with the new response.

```
50 IF A<B INPUT "LOWER";B
```

Again, this is easy to understand : if the random number (A) is lower than the response (B), then tell the user that his or her guess is too high, wait for another response, and again, label it B.

```
60 IF A=B PRINT "THAT'S RIGHT":GOTO 80
```

This is the third thing that could possibly happen, he or she gets it right. It says that if his or her guess equals the random number, then print up that he or she is right. I have then redirected that part of the programme elsewhere by saying "GOTO 80".

```
70 GOTO 40
```

If you will notice, the majority of the programme will be running through lines 40, 50, and 60. Once the computer has been through these lines, it would be a very short game if the computer were not sent back through them to let you have another go ... So we say "GOTO 40", (in other words keep asking me, do I want another go).

```
80 INPUT "TRY AGAIN (Y/N)";C$
```

This is where line 60 sent the computer to. If you have guessed right, it asks you, "TRY AGAIN (Y/N)?". Again, it is waiting for a response and a simple thing like telling the user what sort of response to give, (Y/N) makes it all the easier for the user. You will notice that this response has been labelled "C$". This is because only numbers can be labelled with a single letter variable. If the response is going to be a letter, it must have a dollar sign ($) tacked on so the computer can distinguish between the two.

```
90 IF C$="Y" GOTO 10
```

If our response (C$) is "yes" (Y), start again at line 10. Notice that the response has been placed in "". This is also because it is a letter and not just a simple number. For some reason, a computer has no trouble dealing with numbers, (Only people - Ed.) but when letters are involved, the matter becomes a bit more complex.

```
100 PRINT "TYPICAL HUMAN!":END
```

I have put in a bit of cheek here. You must remember, that in line 90, there is a condition : "IF C$="Y" GOTO 10". Only if C$ is "Y", is that line obeyed. If the response is anything else, the computer will ignore the line and continue with the rest of the programme. Since it has been told to print up a message it will do so, which will probably surprise anybody else who sees it!. After the colon (:), it sees a fresh command which of course, tells it to finish up.

Anyway, that's it for this month. It is a long one but it should keep you going. See ya!

Enhancing VZ Basic by Larry Taylor

The Commodore 64 has advanced hardware supported by an inadequate Basic language, resulting in a number of enhanced Basics being available. Something similar could be produced for the VZ. It must be noted, however, that all such Basics share a common disadvantage. Any program which makes use of them requires the language be loaded before it will function properly.

Because Basic is an interpreted language additional commands can be inserted, if they can be intercepted and executed before reaching the VZ's own interpreter. This is precisely what happens when a disk operating system (DOS) is added. New commands enabling disk operations to be performed, supplement the existing Basic. However, all programs using those extra commands require the DOS to be present before execution or they will not be interpreted correctly.

When a Basic program is RUN, control passes to a machine language ROM routine, the Execution Driver at 1D5AH, which scans each line of the Basic program as it comes to it and begins to translate it. Part of the translation process involves looking for tokens. These are values in the range 128-250 (80H-FAH) that take the place of Basic reserved words e.g. CLS = 132 (84H). Once the word has been identified and checked for correct syntax, control is passed to the corresponding ROM routine before returning to continue the translation. This is similar to one person issuing instructions to another through an interpreter, who first has to translate them before the receiver can act, and is the reason for Basic's slow execution. Most languages get around this problem by having the program translated or compiled before execution.

Tandy's Colour Computer has an enchanced CLS command which enables the user to clear the screen to any one of nine background colours. The syntax is CLSn, where n may be a number in the range 0-8. To illustrate how enhancements can be accomplished, this command will be added to the VZ's repertoire.

On power up the address of the routine which examines each byte in a line of Basic, is stored at 7804H. Because this address is in RAM it can be easily changed. This was done so that at a later stage the DOS could be included. However, it also means that, just as readily, an enhanced form of Basic may be added. The trick is to ensure that, as far as the VZ's interpreter is concerned, nothing unusual has happened. The accompanying assembly language listing shows how this can be accomplished.

Having adjusted the top of memory pointer, the address at 7804H is stored and replaced by our own. The program then locates the new routine at the top of memory. Now each time a byte is to be examined during execution it must first pass through our checkpoint. Once the origin of the call is established, the routine looks for the CLS token, 132 (84H). Only when it has been located does the routine proceed to examine the next byte. This is checked to see if it lies in the range 0-9. Once it has passed this test, the clear screen routine is implemented after first calculating the appropriate value with which to fill the screen. You will notice that not only is it necessary to check for the new command, but also to provide the routine which implements it. In this case a simple block load to the screen has been used. Control is then returned to the ROM processing routine, which prepares to examine the byte following our new command. So, as far as the VZ knows, everything is continuing normally. Tricky isn't it?

I have already successfully used this approach to produce a VZ Printer Patch, which enables all the normal printer functions for owners of EPSON or EPSON compatible printers. The COPY command is intercepted by the patch and as a result its function has been enhanced to allow a proper dump of both the LO-RES and HI-RES screens. One further enhancement that could be explored would be an extension of Basic's SOUND command. The possibilities are limited only by imagination and memory.
